

TEAM REFLECTION W6

M/S STENA DANICA

This week we continued to merge our different features and now we have less hard coded features and use more actual data. There were some problems with accessing the data from Västtrafik, but in the end we made it work. We also did some major refactoring of the classes and packages.

We haven't used the scrum that much the last couple of weeks, but we took time this week to make certain that it was more up to date and reflects what we have worked on and finished. As for effort and velocity, it has been kinda hard to get good estimations, mostly due to people being sick and not able to do as much work. This led to us having to change velocity almost every week, but we did try to estimate anyways to get better at it.

As for acceptance tests, these have mostly been in the form of manual inspection. A goal for next week is to write some tests that we can use as regression tests.

The social contract has been working mostly fine. But we feel like there are maybe some points that are unnecessary or that have not been followed. We are going to review the contract next week when we all meet and make some changes to it.

We have spent much time on the project. However, due to the fact that none of us having made an app before, it has taken some time to get used to the framework and we are still running into problems along the way.

We spent some time in the very beginning making UML diagrams of the app architecture. This has helped us build a better app, which support customer value.

Each week we try to work more and more agile, having not done it before, it is a bit novel. We have at least built our app in an agile way, starting small with not much features and hard coded stuff. Progressively, we have developed it and started thinking vertically.
